Abstraksi :

Word classes are a combination of the bases and the function words. The bases are called open classes, so named because it is relatively easy to create new words in each of those categories, while function words are called closed class since it is less common for speakers of language to create new vocabulary in those categories. The English syntactic marker can be identified by affixation or bound morphemes. The researcher uses inflectional affixes and derivational affixes to create word classes in noun, verb, adjective, and adverb. Inflection does not change word classes and core meaning in the other hand derivation patterns commonly change the word class of the base lexeme and of the change the core meaning. The researcher uses the descriptive and explanative research method for doing the research. The theoretical review contains of the definition of morpheme which consists bound morpheme: Affixation, inflection, derivation, and free morpheme and the definition of word classes which consist of noun, verb, adjective, and adverb. The research shows that the English markers are used to differ the form classes from one class to another class.
